

## 370z| Cars and Coffee

1. Screenshots of the all views of your application displayed in your browser.

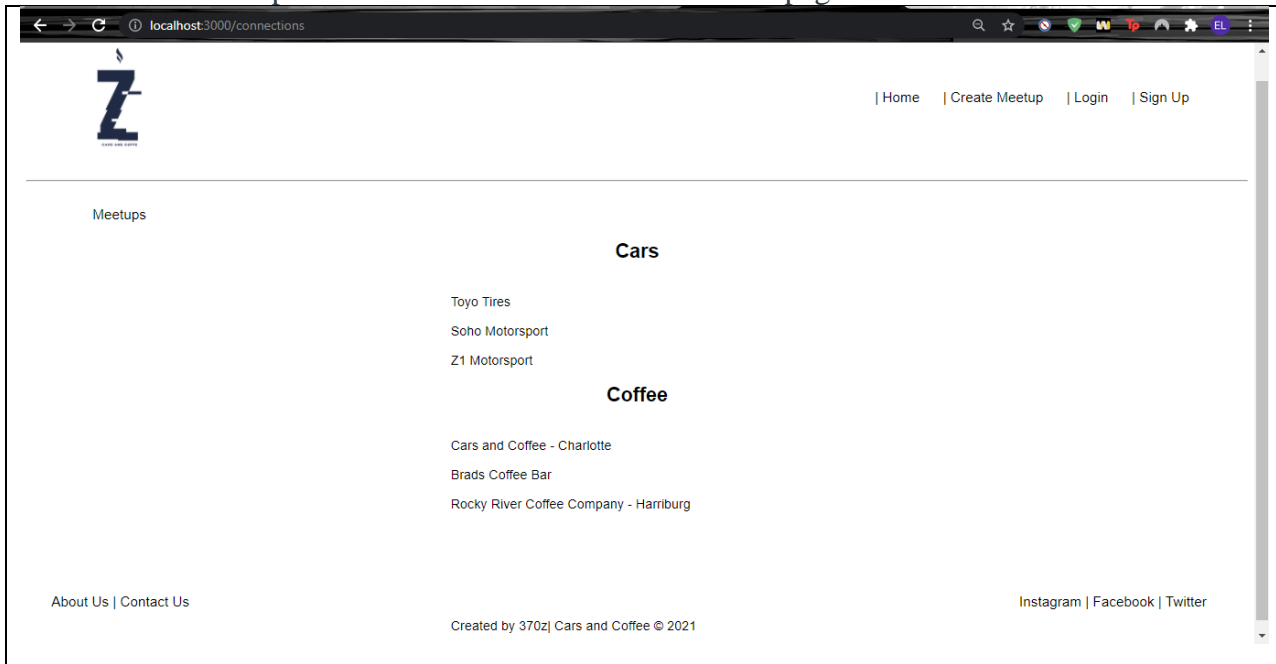

- This is my homepage, I had to zoom out a bit and still couldn't fit the entire page if you scroll you will be able to see the about and contact page when you open my site.

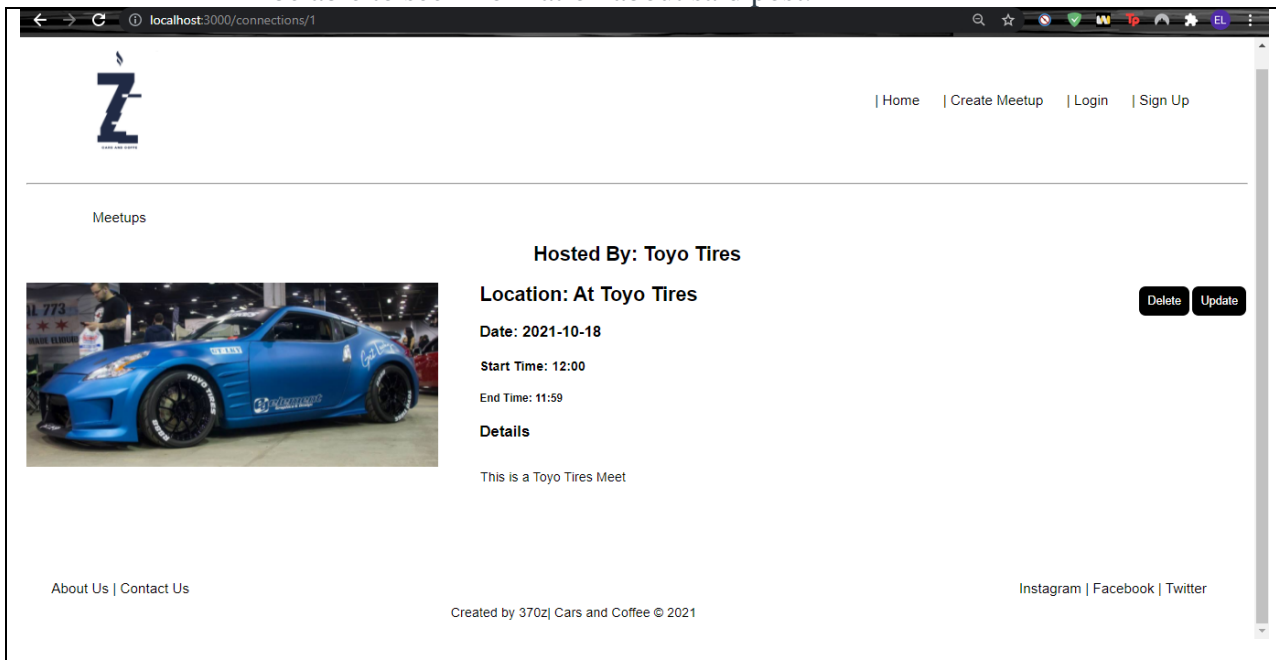

- This is my connections/new where users can submit a new connection, I had to zoom out a bit and still couldn't fit the entire page if you scroll you will be able to see the about and contact page when you open my site

- This is my /connections page, this page shows 2 different topics and their sub posts. I had to zoom out to fit the entire page.

- This is my connections/1 (Toyo Tires) page, if users click this page they will be able to see information about said post.

- This is my connections/1 (Toyo Tires) page after user clicks update, when a user is done making changes they can click submit to save changes. I had to zoom out so nav bar and foot page is available to view if you scroll.

localhost:3000/connections/1/edit?

- This is my error handling when a user enters a page that doesn't exist.

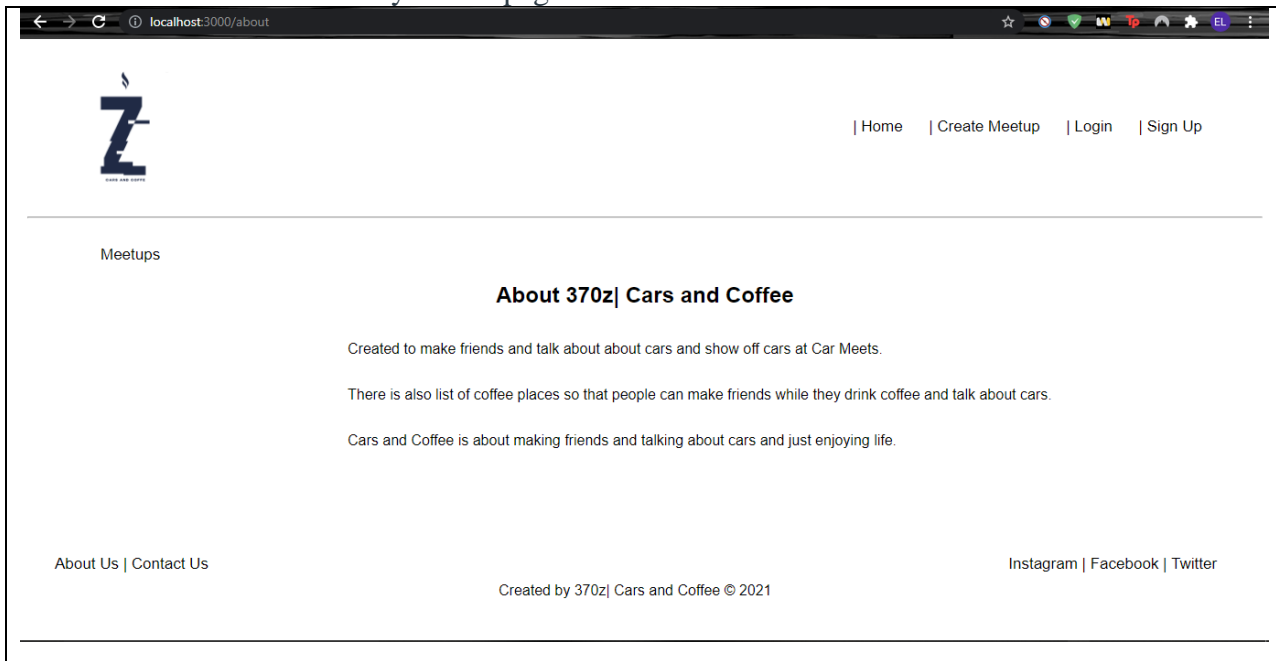

- This is my error handling when there is an internal error/ something wrong with code.

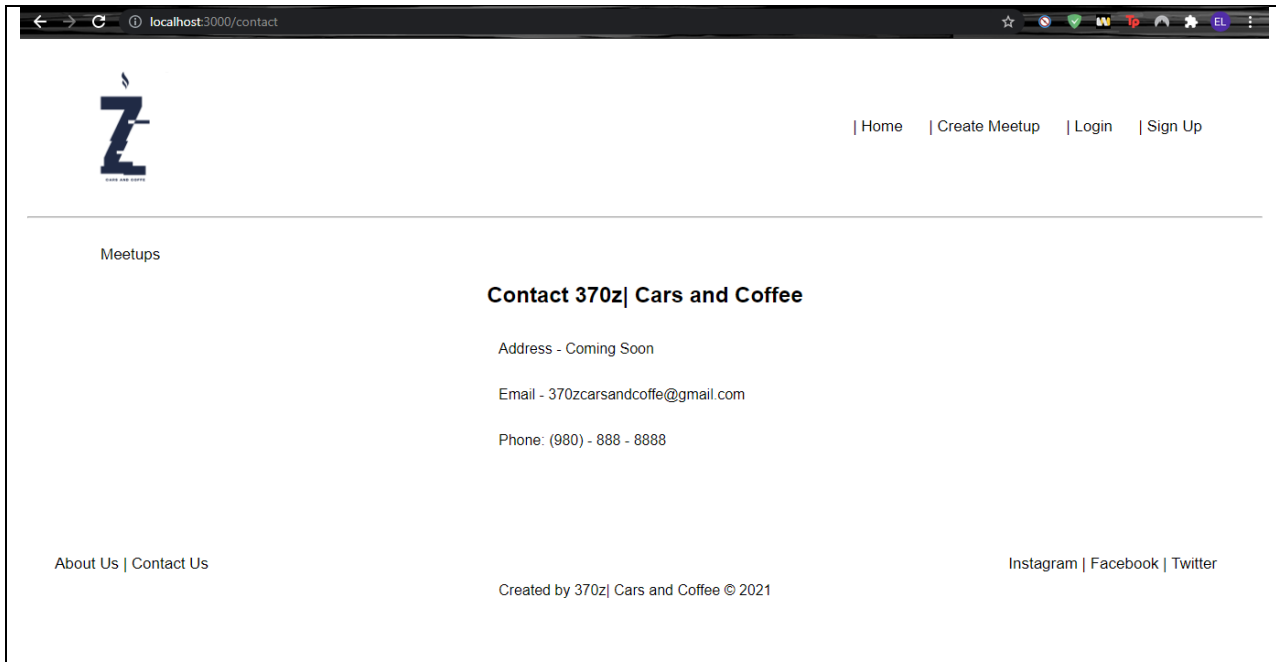

- This is my error handling when a user /connections/id that doesn't exist.

- This is my /about page.

- This is my /contact page

2. No additional features as of now, I plan to add some later on maybe make it look a little prettier.
3. Everything should be complete, project 2 is officially complete, and everything that was required should also be complete.
4. There was a lot of challenges I faced during project 2. For examples, I had a hard time making my program dynamic it took me forever to realize that I needed to arrays in order to organize my topics and make my program dynamic. Furthermore, I struggled with my edit.ejs page because it was not saving the input of the current id that also took me forever to realize. A lot of small errors were my main problem because you had to make sure that where you were sending a method via exporting was going to the right place and also you had to be consistent with your naming. A small error would cause your whole program to fail. I learned to pay attention to detail and document what I was doing via comments helped figure out a lot of the errors I was running into.
